- Open the CSV file *ca_tracts_pop.csv* in a text editor. You will notice that each row of the file contains information about a tract along with the unique identifier we saw in the previous step. Note that this field is called GEO.id2 in the CSV. You will also note that the D001 column has population value for each of the census tract.

```

8. We could import this csv file without any further action and it would be imported. But, the default type of each column would be a String (text). That is ok except for the **D001** field which contains numbers for the population. Having those imported as text would not allow us to run any mathematical operations on this column. To tell QGIS to import the field as a number, we need to create a **sidecar** file with a **.csvt** extension. This file will have only 1 row specifying data types for each column. Save this file as **ca_tracts_pop.csvt** in the same directory as the original **.csv** file. You can also [download the csvt file from here](#).

9. In QGIS, open the CSV file and load it into the map. Then, go to Layer --> Add Delimited Text Layer and click OK.

10. CSV file format. File format: CSV (comma separated values). No geometry (attribute only table). OK.

Create a Layer from a Delimited Text File

File Name:

Layer name: Encoding:

File format: ☒ CSV (comma separated values) ☐ Custom delimiters ☐ Regular expression delimiter

Record options: Number of header lines to discard: ☒ First record has field names

Field options: ☐ Trim fields ☐ Discard empty fields ☐ Decimal separator is comma

Geometry definition: ☐ Point coordinates ☐ Well known text (WKT) ☒ No geometry (attribute only table)

Layer settings: ☐ Use spatial index ☐ Use subset index ☐ Watch file

	POPGROUP.id	POPGROUP.display-label	GEO.id	GEO.id2	GEO.display-label
1	001	Total population	1400000US06001400100	06001400100	Census Tract 4001, Alameda County
2	001	Total population	1400000US06001400200	06001400200	Census Tract 4002, Alameda County

11. CSV ☐ ☐ QGIS ☐ ☐ ☐ ☐ ☐.

12. Select the *tl_2013_06_tract* layer. Right-click on it and select Properties.

13. Click on Layer Properties to open the Layer Properties dialog. Click on the Joins tab. Click on the Add New Join button. Click on the Add New Join button.

14. In the Add vector join dialog, select *ca_tracts_pop* as the Join layer. Next we have to select the field with unique ids in both the shapefile and the CSV. Select **GEO.id2** and **GEOID** as the Join field and Target field respectively. Click OK.

15. Close the Layer Properties dialog and return to the main QGIS window. At this point, the fields from the CSV file are joined with the shapefile. Right-click on the *tl_2013_06_tract* layer and select Open Attribute Table.
