BIL, BIP and BSQ files

GDAL supports BIL, BIP and BSQ files. The GDAL library <http://www.gdal.org> and QGIS can read and write these file formats. QGIS can also write BIL, BIP and BSQ files.

Band interleaved by line (BIL), band interleaved by pixel (BIP), and band sequential (BSQ) are the three main file formats for storing multi-band data. (For more information see [http://web help.esri.com/arcgis/9.3/arcgisserver/arcgisserver.htm](http://webhelp.esri.com/arcgis/9.3/arcgisserver/arcgisserver.htm).)

GDAL uses the following naming convention for these file formats: `image.bil`, `image.bip`, `image.bsq`. The `.hdr` file is used for storing metadata. In QGIS, you can add a raster layer by selecting 'Layer --> Add Raster Layer' and then selecting the file.

For more information, see the GDAL documentation: <http://gdal.org/drivers/raster/bil.html>.

Global Land Cover Facility

Global Land Cover Facility (GLCF) provides AVHRR Global Land Cover Classification data. You can find the data at <http://glcf.umd.edu/data/landcover/data.shtml>.

Global Coverage BSQ files are available. 1 Degree pixel resolution files are also available.

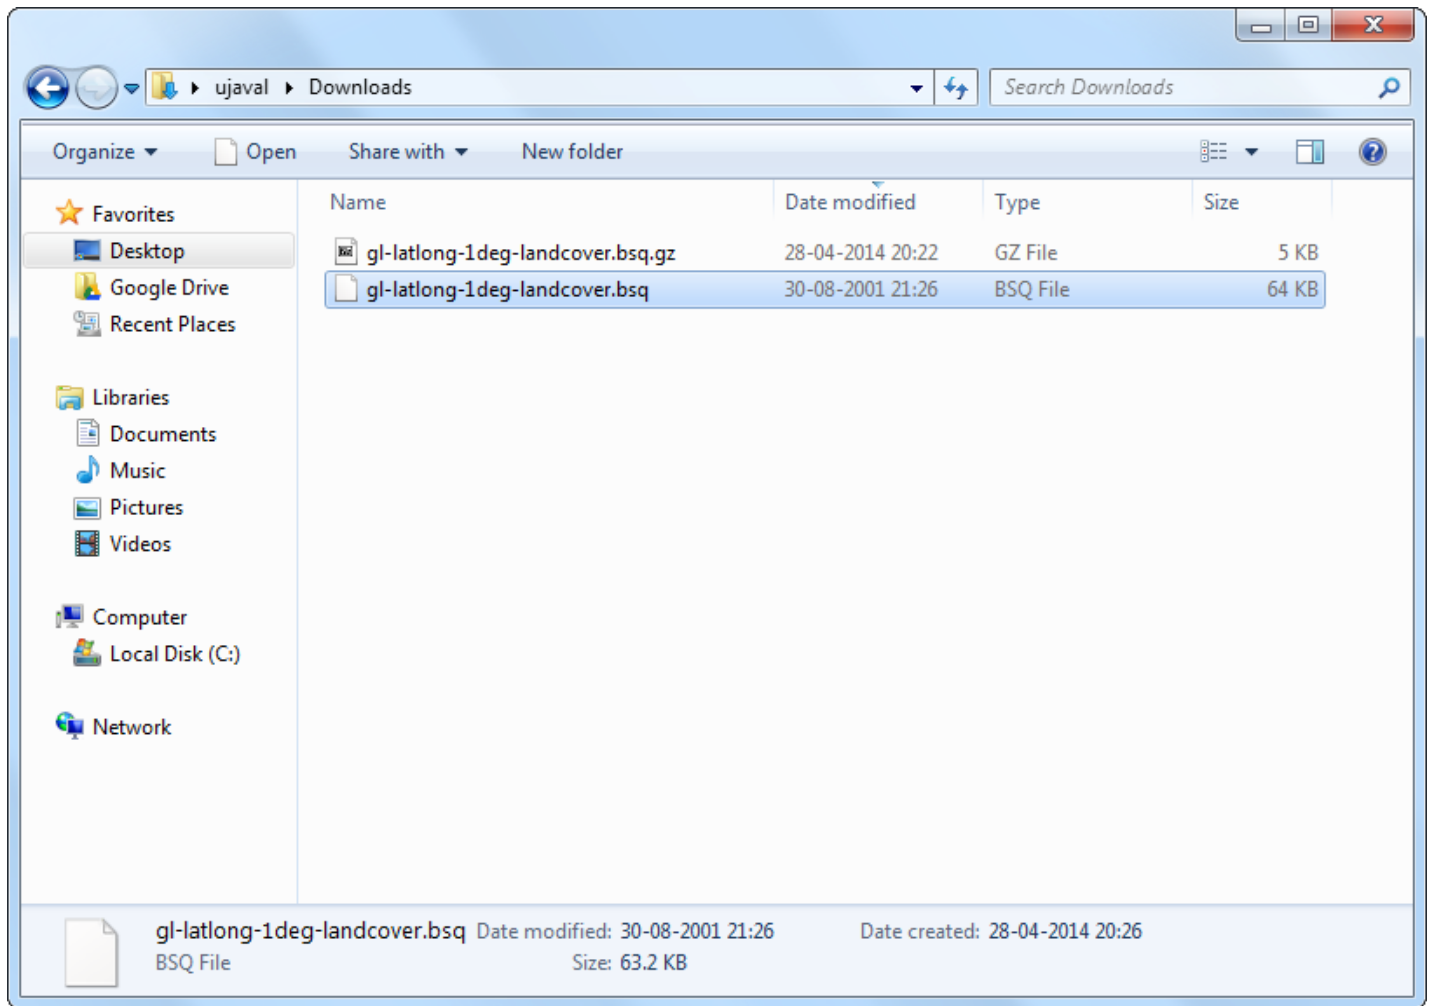

For convenience, you may directly download a copy of the dataset from the link below:

[gl-latlong-1deg-landcover.bsq.gz](http://glcf.umd.edu/data/landcover/data/1deg/1deg-latlong-1deg-landcover.bsq.gz)

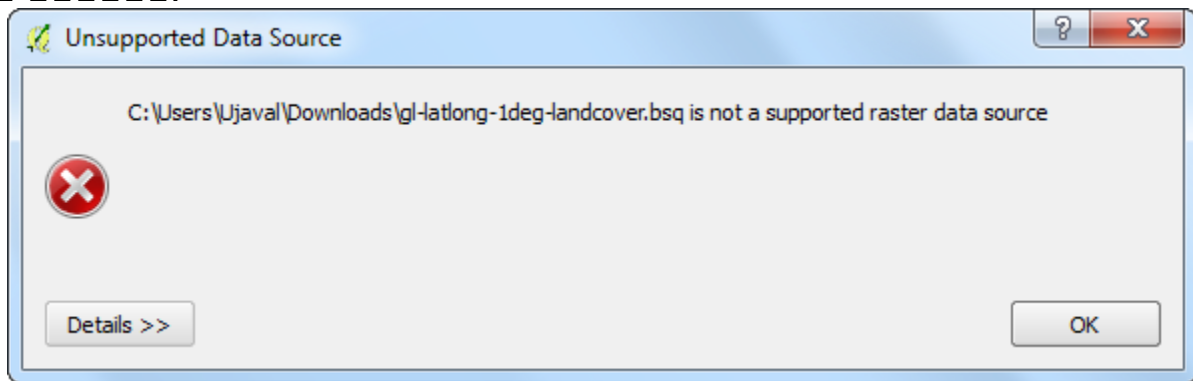

Source: [GLCF]

Steps

1. Unzip and extract the .bsq file. On Windows, you may use the excellent [7-Zip utility](http://www.nirx.net/7zip/) to read and extract .gz file. You will see that you only have a .bsq file named `gl-latlong-1deg-landcover.bsq`. There is no hdr file.

2. QGIS에서 'gl-latlong-1deg-landcover.bsq' 파일을 불러오려 할 때 발생하는 오류 메시지입니다.

3. 이 오류는 'gl-latlong-1deg-landcover.bsq' 파일이 실제로는 'gl-latlong-1deg-landcover.bsq.gz' 파일의 압축 해제된 버전이기 때문입니다. QGIS는 'gl-latlong-1deg-landcover.bsq' 파일을 지원하지 않습니다. 'gl-latlong-1deg-landcover.bsq.gz' 파일을 불러오거나, 'gl-latlong-1deg-landcover.bsq' 파일을 'gl-latlong-1deg-landcover.bsq.gz' 파일로 압축 해제한 후 불러오십시오. 'gl-latlong-1deg-landcover.bsq' 파일의 메타데이터는 <ftp://ftp.glcf.umd.edu/glcf/Global_Land_Cover/Global/1deg/gl-latlong-1deg-landcover.glcf>에서 확인할 수 있습니다.

- Open a text editor and create a file in the format specified in the previous step. Save the file as *gl-latlong-1deg-landcover.hdr*. Make sure the file doesn't have *.txt* at the end. Some of the values in the text files are easy to understand. The ncols and nrows come from the metadata as the Number of Lines and Number of Pixels per Line. The cellsize is 1 as the Pixel resolution from the metadata. The X,Y coordinate of lower-left corner needs to be worked out by us. Since the file covers the entire world and units are lat/long, xllcorner and yllcorner are -180 and -90 respectively. We do not have any information about the nodata_value, so -9999 is a safe bet. From metadata again, Pixel Format is Byte, so nbits will equal to 8 and pixeltype will be byte_unsigned. We do not have information about the byteorder, so leave it as msbfirst. You may download the correctly formatted HDR file from [here](#).

6. `gl-latlong-1deg-landcover.bsq` `gl-latlong-1deg-landcover.bsq`
 QGIS --> Layer --> Add Raster Layer
`gl-latlong-1deg-landcover.bsq` :guilabel: Open
