Lavorare con gli Attributi

Il GIS è costituito di due parti, geometrie e attributi. Gli attributi sono dati strutturati il cui contenuto è riferito a ciascuna geometria. Questa esercitazione mostra come esaminare gli attributi e come effettuare delle interrogazioni elementari sul loro contenuto.

Descrizione dell'esercizio

Il dataset che utilizzeremo in questo esercizio contiene informazioni circa le aree popolate del pianeta. Il nostro obiettivo è quello di cercare e trovare le capitali del mondo che hanno un numero di abitanti superiore a un 1000000.

Other skills you will learn

- · Select features from a layer using expressions.
- Deselect features from a layer using the Attributes toolbar.
- Using Query Builder to show a subset of features from a layer.

Ottenere i dati necessari

Natural Earth has a nice Populated Places dataset. Download the simple (less columns) dataset

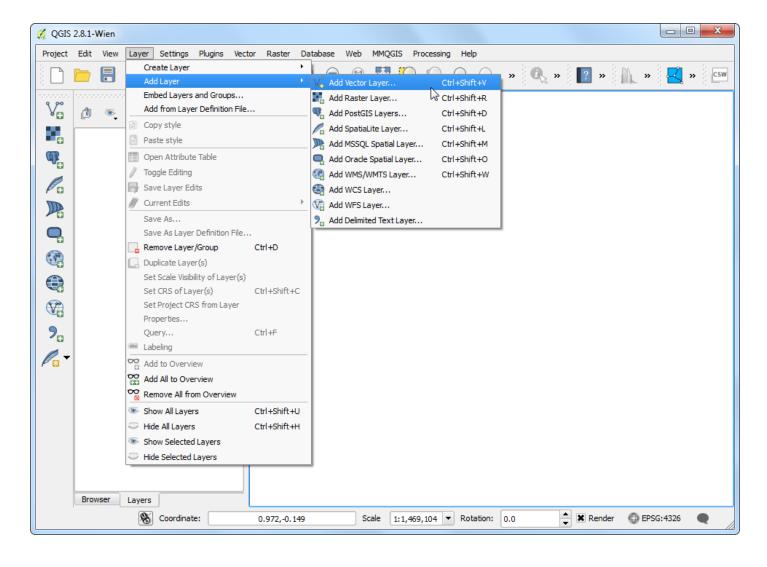

For convenience, you may directly download a copy of datasets from the link below:

ne_10m_populated_places_simple.zip

Fonte Dati [NATURALEARTH]

Procedimento

1. Once you have downloaded the data, open QGIS. Go to Layer • Add Layer • Add Vector Layer.

2. Fate Click su Sfoglia e portatevi nella cartella dove avete scaricato i dati.

3. Individuate e scaricate il file archivio **ne_10m_populated_places_simple.zip**. Non avete bisogno di estrarre il file. QGIS, di solito, è in grado di leggere direttamente i file con estensione .zip. Selezionate il file e fate click su Apri. (Al variare delle versioni di QGIS e dei sistemi operativi, può accadere, in rarissimi casi, che sia necessario estrarre i

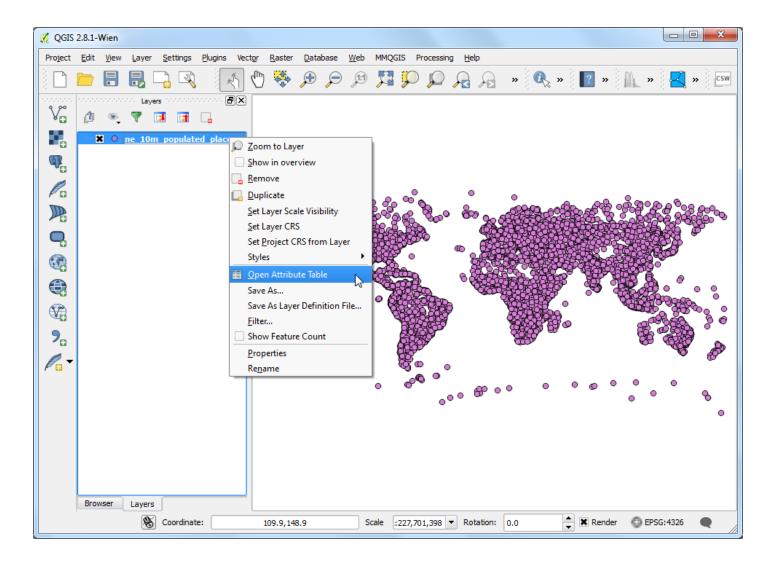

file .zip in modo tradizionale, cioè estraendoli in una cartella e poi aprendo i file così estratti dentro QGIS da quella posizione. N.d.T.).

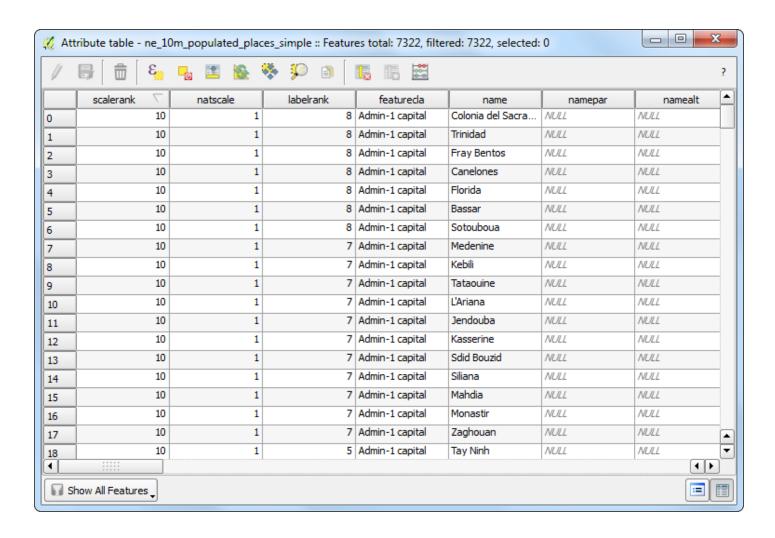

4. Il layer selezionato a questo punto verrà caricato in QGIS e vedrete comparire numerosi punti che indicano i luoghi popolati del pianeta.

5. Right-click the layer and select Open Attribute Table.

6. Esplorate i vari attributi e i relativi valori.

7. A noi interessa la popolazione per ciascuna geometria, quindi **pop_max** è il campo che dobbiamo considerare. Potete fare due volte click sull'intestazione della colonna per ordinare la colonna in ordine discendente.

8. Now we are ready to perform our query on these attributes. QGIS uses SQL-like expressions to perform queries. Click Select features using an expression.

9. In the Select By Expression window, expand the Fields and Values section and double-click the <code>pop_max</code> label. You will notice that it is added to the expression section at the bottom. If you aren't sure about the field values, you can click the Load all unique values to see what the attribute values are present in the dataset. For this exercise, we are looking to find all features that have a population greater than 1,000,000. So complete the expression as below and click Select.

"pop_max" > 1000000

10. Click on Close and return to the main QGIS window. You will notice that a subset of points is now rendered in yellow. This is the result of our query and you are seeing all places from the dataset that have the pop_max attribute value greater than 1,000,000.

11. The goal for this exercise is to find the places that are country capitals. The field containing this data is *adm0cap*. The value 1 indicates that the place is a capital. We can add this criteria to our previous expression using the *and* operator. Let's refine our query to select only those places which are capitals. Click on the Select feature using an expression button in the attribute table and enter the expression as below and click Select and then Close.

```
"pop_max" > 1000000 and "adm0cap" = 1
```

12. Return to the main QGIS window. Now you will see a smaller subset of the points selected. This is the result of the second query and shows all places from the dataset that are country capitals as well as have population greater than 1,000,000. If we wanted to do some further analysis on this subset of data, we can make this selection persistent. Right-click the ne_10m_populated_places_simple layer and select Properties.

13. In the General tab, scroll down to the Feature subset section. Click Query Builder.

14. Enter the same expression you had entered earlier and click OK.

```
"pop_max" > 1000000 and "adm0cap" = 1
```

15. Back in the main QGIS window, you will see rest of the points disappear. You may now perform any other analysis on this layer and only the features that match our expression will be used. You will notice that the points still appear in yellow. This is because they are still selected. Find the Deselect Features from All Layers button under the Attributes toolbar and click on it.

16. You will see that the points are now de-selected and rendered in their original color.
