Găsirea poligoanelor învecinate dintr-un strat

There are some use cases where you want to find all neighboring polygons of each of the polygons in a layer. With a little python script, we can accomplish this and much more in QGIS. Here is an example script you can use to find all polygons that share boundary with each of the polygons in a layer and also add their names to the attribute table. As an added bonus, the script also sums up an attribute of your choice form all the neighboring polygons.

Privire de ansamblu asupra activității

To demonstrate how the script works, we will use a layer of country polygons and find countries that share the border. We also want to compute the total population of the country's neighbors.

Obținerea datelor

We will use the Admin 0 - Countries dataset from Natural Earth.

Download the Admin 0 - countries shapefile...

Sursa de date [NATURALEARTH]

Obținerea script-ului

Download the **neighbors.py** script and save it to your disk.

Procedura

1. Load the ne_10m_admin_0_countries layer by going to Layer → Add Vector Layer.

2. The script uses 2 fields to perform the action. A name field and a field that you want to sum up. Use the Identify tool to click on any feature and examine the attributes. In this case the name field is NAME and we want to sum up the population estimates from POP_EST field.

3. Go to Plugins → Python Console.

4. In the Python Console window, click the Show Editor button.

5. In the Editor panel, click the Open file button and browse to downloaded neighbors.py script and click Open.

6. Once the script is loaded, you may want to change the _NAME_FIELD and _SUM_FIELD values to match the attributes from your own layer. If you are working with the ne_10m_admin_0_countries layer, you can leave those as they are. Click the Save button in the Editor panel if you made any changes. Now click the Run script button to execute the script.

7. Once the script finishes, right-click the ne_10m_admin_0_countries layer and select Open Attribute Table.

8. You will notice 2 new attributes called **NEIGHBORS** and **SUM**. These were added by the script.
